1.0 INTRODUCTION

C.F. Crozier & Associates Inc. (Crozier) was retained by De Zen Realty Company Limited to prepare a Functional Servicing and Stormwater Management Report in support of an Official Plan Amendment (OPA), Zoning By-Law Amendment (ZBA), and Draft Plan of Subdivision (DPoS) application for the proposed condominium development at 142-148 Queen Street South (Site) in the City of Mississauga (City). This report outlines the proposed functional servicing and stormwater management plan for the Site according to the requirements of the City and Region.

1.1 Project Background

The subject site covers an area of approximately 4.23 ha and currently consists of a commercial plaza of several 1-2 storey buildings and a large asphalt parking lot. The site is bound by Tannery Street to the south, a Canadian National Railway track to the west, residential properties and William Street to the north and Queen Street South to the east.

The site is located in a mixed residential/commercial neighbourhood, and is supported by existing municipal water, sanitary, and stormwater infrastructure.

The following reports, design criteria, and as-constructed drawings were referenced during the preparation of this report:

- Regional:
 - Region of Peel Linear Wastewater Standards (March 29, 2023).
 - Region of Peel Public Works, Design, Specifications & Procedures Manual -Watermain Design Criteria (June 2010)
- Municipal:
 - City of Mississauga Transportation & Works Department Development Requirements Manual, Section 8 – Storm Drainage Design Requirements (November 2020).
- As-constructed drawings:
 - 24856-D, 7448-D, and 7449-D: Sewers along Queen Street dated April 28, 1999 and May 1986.
 - C-12878 Queen Street Storm Sewer (October 1961)
 - C-49529 Tannery Street and Crumbie Street Plan & Profile (January 2013)
 - PP-1 Crumbie Street (November 1998)
 - 00-10-SG William Street Servicing Plan (March 2002)
- Other:
 - Topographic Survey by David B. Searles Surveying Ltd. (dated January 17th, 2023).
 - Hydrant Testing by HTO (dated June 19th, 2023).
 - Telecon Subsurface Utility Investigation by Telecon (dated February 27th, 2023).
 - Tannery Street Storm Sewer Design for Area Z-38W (City of Mississauga, October 2012).
 - Hydrogeological Assessment by Terrapex Environmental Ltd (February 2024).

2.0 PROPOSED DEVELOPMENT

Based on the Site Plan provided by SRM Architects + Urban Designers the proposed development consists of the following elements:

- Building 1A: 13 storeys, 283 units
- Building 1B: 13 storeys, 243 units
- Building 2A: 15 storeys, 268 units
- Building 2B: 2 storey commercial building (existing pub building)
- Building 3A: 15 storeys, 256 units
- Building 3B: 15 storeys, 256 units
- Building 3C: 12 storeys, 211 units
- Building 3D: 10 storeys, 141 units
- Building 4: 8 storeys, 150 units
- Underground parking structures below each building.
- Public Park (0.1 ha)
- Market Square (POPS) (~0.20 ha)
- 3 new Public Streets (A, B & C) with connections to Queen St, Williams St, and Crumbie St.

2.1 Equivalent Population

The Site equivalent population for the proposed development as summarized in **Table 1**. The architectural package has provided the total number of units for each building, however, the exact number of 1, 2, and 3 bedroom units is not determined at this time. SRM has advised that the anticipated unit split is approximately 72% 1-bedroom, 18% 2-bedroom, and 10% 3-bedroom units. Using equivalent unit populations of 1.8, 2.1, and 3.1 persons per 1, 2, and 3-bedroom units respectively, the average unit rate is equivalent to 2.1 persons per residential unit.

| Building | Residential Units | Persons per Unit | Residential Population | Non-Residential Area (m²) | Density (ppha) | Non- Res Pop | Total Population |
|----------------|----------------------|---------------------|---------------------------|------------------------------|-------------------|--------------------|---------------------|
| 1A | 283 | | 594 | 1782 | | 12 | 607 |
| 1B | 243 | | 510 | 1460 | | 10 | 521 |
| 2A | 268 | | 563 | 0 | | 0 | 563 |
| 2B | 1 | 0.1 | 2 | 300 | 70 | 2 | 4 |
| 3A | 256 | ۷.۱ | 538 | 0 | 70 | 0 | 538 |
| ЗB | 256 | | 538 | 0 | | 0 | 538 |
| 3C/D | 352 | | 739 | 0 | | 0 | 739 |
| 4 | 150 | | 315 | 379 | | 3 | 318 |
| Res Population | | 3799 | Non-Res Po | pulation | 27 | 3826 | |

Table 1: Estimated Equivalent Population

3.0 GROUNDWATER DRAINAGE CONDITIONS

A Hydrogeological Assessment report for the subject site was completed by Terrapex Environmental Ltd. which detailed the Site's subsurface and groundwater conditions. The major conclusions of the hydrogeological assessment are as follows:

- Groundwater exceeds City of Mississauga Quality levels for discharge to Storm Sewers with elevated phenolics and manganese.
- Short-Term (Construction) dewatering of Phase 1 = 251,000 L/d (2.9 L/s).
 - Note: The above rate is associated with Phase 1 Buildings 1A & 1B combined.
- Long-Term (Post-Construction) dewatering of Phase 1 (Building 1A & 1B) = 86,400 L/d (1.0 L/s)
 - Note: Based on the daily rate for Phase 1, it is estimated that the total long-term discharge rate for all buildings is approximately 5 L/s.

Please refer to the Hydrogeological Assessment prepared by Terrapex for further details.

Short-term de-watering is to be designed by the de-watering contractor, with de-watering operations taking place prior to and during any excavation. Any groundwater which is pumped to the City's sewers will require pre-treatment in order to meet the groundwater quality limits as specified in the City's Municipal Code. The dewatering contractor will confirm groundwater quality to assess the required level of pre-treatment necessary. The property owner should obtain short-term to discharge private water to the combined sewer, ensuring any short-term discharge follows the City's municipal code. All short-term discharge activity shall be terminated prior to building occupancy and such that short-term discharge will not simultaneously discharge with the proposed storm or sanitary flows from the building.

Long-term dewatering will be in the form of building foundation drainage (by structural) which will be collected, pumped (by mechanical), and treated for quality levels suitable for discharge to the municipal storm sewer system. The quality treatment design component will be done at the Site Plan stage for each respective Building and or Phase of the development.

It is proposed to discharge all groundwater and foundation drainage, in both the short and long term, to the municipal storm sewer system. The permanent discharge of groundwater in the long-term will be accounted for in the stormwater management design and quantity control targets for each individual Block and the Site as a whole. Refer to Section 6.0 & 7.0 for further details and discussion.

4.0 WATER SERVICING

The Region of Peel is responsible for the operation and maintenance of the public water system servicing the Site, and any private system connecting to this public system. The following sections outline the existing and proposed design of water servicing for the proposed development.

4.1 Existing Water Servicing

A review of the available as-constructed drawings indicates that there is an existing 300 mm diameter watermain located along Queen Street, 200mm diameter watermain located along Tannery Street, and a 150mm William Street all in proximity to the site. Municipal hydrants are located in close proximity to the site.

There are currently several water service connections and private lines which traverse through the site. Please refer to **Appendix A** for As-Builts, Telecon's investigation figure and **Drawing C102** for additional details on the location of the existing water infrastructure. It is anticipated that all existing water services will be capped, removed and/or abandoned through redevelopment of the site. The exception is Building E, the existing pub, which will remain in operation and continue to use all existing services from Queen Street.

4.2 Water Design Demand

The Region's Design Criteria for Linear Infrastructure was used to estimate the proposed water demands for both pre and post-development conditions. An average daily demand of 280 L/c/d for residential and 300 L/c/d for non-residential was used in accordance with Region criteria. A summary of the results is presented in **Table 2**, with detailed water design demand calculations provided in **Appendix B**.

| Table 2. Existing and Hoposed Domestic Water Demand | | | | | |
|---|-------------------------------|-------------------------------|-----------------------------|--|--|
| | Average Daily Demand (L/s) | Maximum Daily Demand (L/s) | Peak Hourly Demand (L/s) | | |
| Existing Water Demand | 1.03 | 1.44 | 3.08 | | |
| Proposed Water Demand | 12.41 | 24.80 | 37.22 | | |
| Increase in Water Demand | 11.38 | 23.36 | 34.14 | | |

Table 2: Existing and Proposed Domestic Water Demand

As shown in **Table 2**, the peak hourly water demand for the proposed development is 37.22 L/s. Refer to Appendix B for detailed water demand calculations for each building and the total site.

4.3 Fire Flow Demand

The Fire Underwriters Survey 2020 (FUS) was referenced to complete the fire flow demand analysis for the proposed development. It is assumed that all proposed buildings will be constructed with a minimum 2-hr fire resistance rating for all structural elements and will be designed with a minimum 1-hr fire resistance rating for all vertical openings and exterior vertical openings. As such, flow requirements were calculated based on fire-restrictive construction (C = 0.60) and consider a fire area of the largest floor plus 25% of each of the two immediately adjoining floors. Refer to the latest FUS 2020 Guidelines and Site Statistics provided from the Architect in **Appendix A** for reference.

As the proposed building use is residential (low hazard) a "Limited-Combustible" occupancy hazard has been applied. The proposed building will have a fire line connection to the same municipal watermain system as the fire department connection and will be supported by an automatic and fully supervised fire suppression system in conformance with NFPA 13 sprinkler standards. Exposure charges were included in the calculations to account for various existing residential and commercial properties in proximity to the Site. The fire flow demands for each building are summarized in **Table 3**.

| Building | Contributing Area (m²) | Construction Type (Coefficient) | Occupancy Surcharge (%) | Sprinkler Protection (%) | Fire Demand Flow (L/s) | Duration of Fire Flow (hr) |
|----------|------------------------------|---------------------------------------|-------------------------------|--------------------------------|------------------------------|-------------------------------------|
| 1A | 2928 | Fire-Resistive (0.6) | -15% | -50% | 50.0 | 1.25 |
| 1B | 2564 | Fire-Resistive (0.6) | -15% | -50% | 50.0 | 1.25 |
| 2A | 2424 | Fire-Resistive (0.6) | -15% | -50% | 50.0 | 1.25 |
| 2B | 14050 | Ordinary (1.0) | 0% | 0% | 100.0 | 2.00 |
| 3 (A-D) | 2444 | Fire-Resistive (0.6) | -15% | -50% | 117.0 | 2.00 |
| 4 | 2424 | Fire-Resistive (0.6) | -15% | -50% | 50.0 | 1.25 |

| Table | 3: | Estimated | Fire | Flow | Demand |
|--------|----|-----------|------|-------|--------|
| i ubic | υ. | Lamaica | 1110 | 11011 | Demana |

As shown in **Table 3**, the proposed development requires fire flows ranging from approximately 50.00 L/s to 117 L/s for a duration of 1.25 to 2.0 hours per the FUS calculations.

Hydrant flow tests were conducted by Hydrant Testing Ontario (HTO) on June 19th, 2023 on the 300mm, 200mm, and 150mm watermains surrounding the Site. Results are summarized as follows:

| Queen St 300mm = | 341 L/s @ 20 psi, 64 psi static pressure |
|--------------------|--|
| Tannery St 200mm = | 239 L/s @ 20 psi, 69 psi static pressure |
| William St 150mm = | 120 L/s @ 20 psi, 60 psi static pressure |

As tested, both the Queen St and Tannery St watermains have substantial pressure and flow available. It is noted that the William St watermain is currently a dead-end system on a residential cul-de-sac. It is anticipated that, thru development of the site and connecting/looping of the proposed water network through the new Streets A & B that this will significantly improve the flow available on William Street and provide adequate flow through the development as a whole. The FUS calculations and hydrant flow test report are provided in **Appendix B**.

Note that the FUS value is a conservative estimate to assess the capacity of the municipal water supply system to provide fire protection for the proposed development. The Mechanical or Sprinkler Engineer for this development will complete the required analyses for building fire protection and the Architect will design fire separation methods per the determined fire flow rate in order to meet municipally available flows and pressures.

4.4 Proposed Water Servicing

New 300mm dia municipal watermains will be installed along the entire length of new Streets A, B and C. Connections will be made to Queen St, Tannery St, and William St, creating an internally looped and interconnected system with the existing surrounding network.

Proposed Buildings 1A and 1B, as it represents Phase 1 of the development, will be serviced from the existing 300mm watermain on Queen St. Due to its total building height, it will be supplied with 2 fire services, and is anticipated to be serviced with 2 domestic services, all from Queen Street.

Proposed Buildings 2A, 3A, 3B, 3C/D and 4 will all be serviced with domestic and fire connection(s) from the new watermains within Street A, B and C. Building 3A-D is anticipated to be supplied with 2 fire services due to its height and size.

Existing Building 2B will continue to utilize its existing water service connection from Queen Street.

All proposed water services shall enter the buildings in the mechanical/service rooms located in the underground P1 level. A water meter, backflow preventor and detector check assembly will be installed per mechanical details and specifications on all domestic lines, and a detector check valve will be installed on all fire services.

Municipal hydrants are proposed along Street A, B, and C at regular intervals as required by Peel Region standards.

Please refer to **Drawing C102** for the proposed servicing plan.

5.0 SANITARY SERVICING

The City of Mississauga is serviced by a network of local and trunk sanitary sewers. The Region of Peel is responsible for the operation and maintenance of the public sewage collection and treatment systems within its jurisdiction, and any private sewage system that connects to this public system.

5.1 Existing Sanitary Servicing

A review of active Region and City records, as-built drawings and field investigations site indicates that the Site is currently serviced by a private 200mm diameter sanitary sewer that connects to a 250mm diameter public sanitary sewer in Crumbie Street. There are also several service connections directly to the existing 300mm sewer in Queen St. All site sanitary flows ultimately are collected by a 3000mm diameter trunk sanitary sewer that leads to Clarkson Wastewater Treatment Plant.

Please refer to **Appendix A** and **Drawing C102** for further details on the location of the existing sanitary infrastructure. It is anticipated that all existing sanitary services will be capped, removed and/or abandoned through redevelopment of the site. The exception is Building E, the existing pub, which will remain in operation and continue to use all existing services from Queen Street.

5.2 Sanitary Design Flow

The Region of Peel's Linear Wastewater Standards (March 29, 2023) was used to estimate the existing and proposed sanitary design flows generated from the Site. As described in **Section 2.1**, the proposed development is anticipated to generate an equivalent residential population of 3836 people. An average sanitary flow of 290 L/c/d & 270 L/c/d is used to estimate average daily flow for residential and non-residential development populations. An infiltration rate of 0.26 L/s/ha is also added to all Site areas. A summary of the results is presented in **Table 4**, with detailed calculations provided in **Appendix C**.

| | Average Flow (L/s) | Peak Flow (L/s) | Infiltration Flow (L/s) | Total Peak Flow (L/s) |
|---------------|--------------------|--------------------|----------------------------|--------------------------|
| Existing Flow | 0.99 | 3.97 | 1.1 | 5.07 |
| Proposed Flow | 12.8 | 43.0 | 1.1 | 44.1 |
| Increase Flow | 11.81 | 39.03 | 0.00 | 39.03 |

| Table 4: Existing and Proposed Sanitary Design Flow |
|---|
|---|

As shown in **Table 4**, the total peak sanitary flow for the proposed development was estimated to be 44.1 L/s, representing an increase of 39.03 L/s from existing conditions.

The flows from the Site will outlet to either Queen Street or Crumbie Street, based on the proposed servicing configuration (see Section 5.3). The following is a summary of total peak flows by outlet:

| Total Peak Flow to Queen St | = 18.2 L/s |
|-------------------------------|------------|
| Total Peak Flow to Crumbie St | = 29.0 L/s |

Refer to Appendix C for detailed sanitary demand calculations for each building and the total site.

5.3 Proposed Sanitary Servicing

Proposed Buildings 1A and 1B, as it represents Phase 1 of the development, will be serviced from the existing 300-375mm sanitary sewers on Queen St and will therefore not require any of the future sewers to be constructed to Crumbie. Building 4 will also be serviced by the 300-375mm sewer on Queen Street as it has direct frontage. This is done to more evenly distribute the total development flows between both Queen Street and Crumbie Street.

Existing Building 2B will maintain its existing service connection to Queen Street.

New 200-250 mm diameter PVC sanitary sewers will be constructed within Streets B and C and will convey all wastewater towards the existing 250 mm diameter sanitary sewer on Crumbie Street. Proposed Buildings 3 A/B/C/D and 2A will be serviced by these new sewers, as well as the Public Park Block and Market Square.

All new sanitary service connections with control manhole at the property line per Region of Peel standards. Existing sanitary services will be decommissioned in accordance with Region criteria.

The following is a summary of the proposed Buildings and their respective connection points:

| Building 1A | Queen St – existing 300mm |
|---------------|---|
| Building 1B | Queen St – existing 375mm |
| Building 2A | Street C – proposed 250mm |
| Building 2B | Queen St – existing 375mm (existing service to be maintained) |
| Building 3A | Street C – proposed 250mm |
| Building 3B | Street B – proposed 200mm |
| Building 3C/D | Street B – proposed 200mm |
| Building 4 | Queen St – existing 300mm |
| Park | Street B – proposed 200mm |
| Market Square | Street C – proposed 200mm |
| | |

| Street A | No sanitary |
|----------|---|
| Street B | Proposed 200mm, conveys to Street C |
| Street C | Proposed 250mm, discharge to ex 250mm in Crumbie Street |

The proposed sanitary sewers and service connections are shown in Drawing C102.

6.0 STORM DRAINAGE

The following subsections detail the existing and proposed storm drainage conditions for the Site.

6.1 Existing Drainage Conditions and Storm Sewers

A review of City records, as-built drawings and field investigations site indicates that site drains via a combination of public sewers within adjacent roadways and internal easements as well as a network of private on-site sewers and catchbasins.

The existing 375mm Queen Street sewers fronting the site are tributary to an external upstream catchment area of approximately 4.38 ha (see **Figure 1** and the Tannery Street Storm Sewer Design for Area Z-38W, City of Mississauga, October 2012 record drawing).

The Site also drains a portion of its frontage overland directly to these sewers, which flows southward to an existing manhole (EX STM MH59) approximately 45m north of the southern-most property limit along Queen St. These sewers then turn westward into the site within an existing public easement and increase in size to 450mm diameter and convey flow to an existing 975mm storm sewer in Crumbie Street (see **Figure 2**).

The majority of the Site is capture by on-site catchbasins where a series of private sewers (varying in size from 150-675mm) conveys flow in a westerly and southerly direction, eventually joining with the 450mm public sewer at the existing 975mm Crumbie Street sewer (see **Figure 2**).

Ultimately, all flows are conveyed to the 975mm storm sewer in Crumbie Street before ultimately discharging to Mullet Creek via Tannery Street.

Per the Tannery Street Storm Sewer Design record drawing and design sheet, the existing 975mm storm sewer in Crumbie Street was designed to receive all of the external Queen St upstream and Site areas, a total of 9 ha at a runoff coefficient of 0.75. **Table 5** provides a summary of the pre-development drainage areas, runoff coefficients, and outlet destinations for the existing drainage conditions.

| Catchment | Land Use | Area (ha) | с | Outlet Destination |
|--|--|--------------|------|--|
| External Upstream Queen Street + Site Area | Commercial and Residential neighbourhood | 8.99 | 0.75 | Ex. 975mm diameter storm sewer on Crumbie Street |

Table 5: Pre-Development Land Areas and Runoff Coefficients

6.2 Proposed Drainage Condition Summary

Storm drainage for the proposed development will follow the existing conditions pattern and utilize the existing 975mm storm sewer in Crumbie Street as the primary outlet. This will be accomplished by the construction of new storm sewers within new public roads Streets A, B, and C that will convey stormwater southward to Crumbie Street. Additionally, the existing 450mm sewer within the on-site easement will be upsized to a 675mm sewer and reconstructed within Street C to continue discharging into Crumbie Street.

All private Blocks will be serviced with at least one storm service and provide on-site stormwater management. As noted in Section 3.0, all permanent foundation drainage from each Block/Building will discharge to the municipal storm system. Refer to Section 7.2 for further details.

6.2.1 Phase 1 Drainage Conditions

The Site is proposed to be built in a phased approach, starting with Phase 1 which consists of Building 1A and 1B fronting Queen Street. It is proposed that a storm service to Building 1A and Building 1B will be provided directly into the existing 375mm Queen St storm sewers, thereby utilizing the existing sewer infrastructure and not requiring the full build-out of any downstream sewers.

In order to not increase the net flow into the existing Queen St sewers in Phase 1, the allowable discharge rate of Phase 1 will be restricted to predevelopment rate of frontage area that is currently draining uncontrolled into Queen Street. Under existing conditions, only a small portion of the Phase 1 area drains to the existing Queen Street sewers, summarized in **Table 6**.

| Catchment | Area (ha) | с | Existing/Allowable Flow Rate (L/s) | Phase 1 Building | |
|-----------|--------------|------|---------------------------------------|------------------|--|
| UNC1 | 0.04 | 0.90 | 9.9 | 1A | |
| UNC2 | 0.02 | 0.90 | 5.0 | 1B | |

Table 6: Phase 1 Pre-Development Conditions for Phase 1 Allowable

To maintain the existing flow rate from pre to post conditions in Phase 1, Building 1A and Building 1B will be required to provide stormwater management quantity control measures to reduce peak runoff rates such that they are equivalent to the predevelopment condition of UNC1. This will further be discussed and elaborated in Section 7.2.

6.2.2 Ultimate/Full Build-Out Drainage Conditions

It is anticipated that after Phase-1, development will require the buildout of Streets B and C, and therefore trigger the construction of the new storm sewers within proposed roads to the Crumbie Street outlet.

Per the Tannery Street Storm Sewer Design record drawing and design sheet, the existing 975mm storm sewer in Crumbie Street was designed to receive all of the external Queen St upstream and Site areas (total 9 ha), therefore all external and Site areas have been allocated a runoff coefficient of 0.75 (with the exception of the Site Park, C=0.30).

The Crumbie St 975mm storm sewer design was designed per municipal standards for the 10-year storm event. Therefore all proposed flows to the Crumbie Street sewer will be designed to not exceed this designed rate at the 10-year event.

The post-development sub catchment areas are shown in Figure 3 and summarized in Table 7 below.

| Land Use | Area (ha) | с |
|----------------------------|---------------------|------|
| EXTIA, EXTIB, EXTIC, EXTID | 4.38 | 0.75 |
| Queen Street External | 4.38 | 0.75 |
| EXT2 | 0.06 | 0.75 |
| EXT3 | 0.32 | 0.75 |
| North West External | 0.38 | 0.75 |
| Site ROW | 1.06 | 0.75 |
| Site Private Blocks | 3.08 | 0.75 |
| Site Park | 0.10 | 0.50 |
| Total Site | 4.24 | 0.74 |
| TOTAL | 9.00 | 0.75 |

Table 7: Post-Development Land Areas and Runoff Coefficients

Streets A, B and C will be graded to ensure both minor and major overland flow is directed towards the Crumbie Street ROW which is consistent with predevelopment conditions. The post-development private blocks (ie: Buildings 1-4) primarily consist of roof area coverage area which will be captured and controlled by private stormwater management infrastructure. The new public right-of-ways and the public Park block are all proposed to have no quantity controls.

The proposed storm sewers are designed to capture the 10-year design storm per City of Mississauga design standards. As per the Tannery Street Storm Sewer Design for Area Z-38W the allowable release rate from the 9 ha drainage catchment area in which the Site is situated is **1.46 m³/s (=1458.8 L/s)**. Refer to Appendix D for further information and Crumbie St storm sewer design info.

Refer to drawings **C102** and **PP1/PP2** for the proposed Servicing Plans and **C103** for the proposed Site Grading Plan.

7.0 STORMWATER MANAGEMENT

7.1 Stormwater Management Criteria

A summary of the stormwater management criteria applicable to the subject Site and development is as follows:

- **Quantity Control**: Flows from the Site will be controlled at the 10-year event to ensure compliance with the Tannery Street Storm Sewer Design record drawings (October 2012).
- **Erosion Control (Water Balance Target)**: Retain the first 5mm of runoff on-site through initial abstraction and water harvesting/re-use.
- Quality Control: 80% Total Suspended Solids (TSS) removal on annual loading basis of the stormwater runoff leaving the development per the MECP Enhanced Water Quality Control Criteria.

7.2 Stormwater Quantity Control

Using the Tannery Street Storm Sewer Design drawing as the basis of flows designed to enter the 975mm Crumbie Street sewer, a total allowable release rate of **1.46 m³/s (=1458.8 L/s)** at the 10-year event is identified. This total catchment includes both the entire site area (4.24 ha) and external area (4.76 ha), all allocated a runoff coefficient of 0.75. The External and Site Allowable discharge rates are therefore as follows:

Total Catchment rate = 1458.8 L/s (8.99 ha, C=0.75, i_{10} = 22.14 mm/hr)

External Areas flow rate = 772.4 L/s (4.76 ha, C=0.75, i_{10} = 22.14 mm/hr)

Site Area Allowable rate = 687.6 L/s (4.24 ha, C=0.75, i₁₀ = 22.14 mm/hr)

The subject Site is comprised of private Blocks, public Streets, and a public Park. It is anticipated that both the public Streets and the park will have a runoff coefficient equal to or less than C=0.75, therefore no quantity controls will be implemented.

For the private Blocks (Buildings 1-4), stormwater quantity controls will be implemented to attenuate up to the 100-year flows to the 10-year allowable rate. Captured runoff within each private Block will be controlled using orifice tubes/plates with a detention storage volume provided as part of a SWM Facility in the basement levels of each building.

As noted in Section 3.0, it is estimated that approximately 5 L/s of permanent foundation drainage is anticipated over the entire site development. To be conservative, a total rate of 10 L/s over the whole site has been accounted for in the quantity control design. This 10 L/s rate has been evenly distributed over each development Block/Building based on its relative area.

The following Table 9 summarizes the allowable release rate at the 100-year event for each Private Block/Building equivalent to the 10-year allowable rate as well as the associated storage requirements.

| Site Catchment | Area (ha) | STM Target Release Rate @ 100-yr Event (L/s) | Approximate Storage Required @ 100yr (m ³) | Foundation Drainage Allowance to Storm (L/s) | Total Discharge to Storm (L/s) |
|-------------------|--------------|--|---|---|---|
| Building 1A | 0.44 | 8.5 | 219.4 | 1.4 | 9.9 |
| Building 1B | 0.29 | 4.0 | 161.5 | 1.0 | 5.0 |
| Building 2A | 0.29 | 46.1 | 54.2 | 0.9 | 47.1 |
| Building 2B | 0.27 | 42.9 | 50.5 | 0.9 | 43.8 |
| Building 3A | 0.44 | 70.0 | 82.2 | 1.4 | 71.4 |
| Building 3B | 0.41 | 65.2 | 76.6 | 1.3 | 66.5 |
| Building 3C/D | 0.65 | 103.4 | 121.5 | 2.1 | 105.5 |
| Building 4 | 0.28 | 44.5 | 52.3 | 0.9 | 45.4 |
| Total Site | 3.08 | 384.6 | 818.1 | 10.0 | 394.6 |

Table 9: Private Block Allowable Discharge Rate

The following **Table 10** summarizes the post-development quantity control results from the 2 to 100-year storm events to meet the allowable targets for both the individual Site area (4.24 ha) and the total catchment area (9.0 ha).

| Return Period | Post-Dev Site Rate (4.24 ha; incl. all Blocks, Park, ROW) (L/s) | Allowable Site Discharge Rate (L/s) | Total Rate (9.0 ha; incl. External + Site) (L/s) | Allowable Total Discharge Rate to Crumbie (L/s) | |
|------------------|--|---|---|--|--|
| 2 yr | 379.0 | 415.3 | 845.5 | 881.1 | |
| 5 yr | 490.5 | 558.3 | 1117.6 | 1184.4 | |
| 10 yr | 604.1 | 687.6 | 1376.5 | 1458.8 | |
| 25 yr | 635.2 | 789.7 | 1522.3 | 1675.5 | |
| 50 yr | 663.3 | 882.5 | 1654.6 | 1872.2 | |
| 100 yr | 692.3 | 978.6 | 1791.6 | 2076.2 | |

Table 10: Summary of Peak Flows, Storage Volume Required & Release Rates

Preliminary design of the SWM facility and detention storage indicates that an approximate is 625.6 m³ is required to be provided across the private Blocks within the Site. Detailed stormwater management calculations are provided in **Appendix D**.

7.3 Water Balance

Achieving the Site water balance criteria of capturing an equivalent 5mm depth of runoff from the site will be done through a combination of initial abstraction and rainwater harvesting. All surfaces have an inherent initial abstraction depth which is typically equivalent to 1mm for impermeable surfaces and 5mm for permeable surfaces. As all site catchments are comprised of a portion of impermeable area, additional rainfall harvesting will be required to meet the 5mm requirement.

It is proposed that no additional capture beyond initial abstraction will be done in the new public ROW's Street A, B and C. Therefore, the private Blocks (Buildings 1A-4) will harvest and additional depth beyond their own 5mm to compensate for the ROW's. Refer to **Table 11** for a summary of capture depths associated with each catchment.

| Catchment | Area (ha) | с | Required Abstractio n (mm) | Initial Abstraction (mm) | Additional Capture Depth (mm) | Total WB Capture Depth (mm) |
|------------|--------------|------|-------------------------------------|--------------------------------|-------------------------------------|-----------------------------------|
| 201A | 0.44 | 0.75 | | 1.86 | 4.23 | 6.08 |
| 201B | 0.29 | 0.75 | | 1.86 | 4.23 | 6.08 |
| 202A | 0.29 | 0.75 | | 1.86 | 4.23 | 6.08 |
| 202B | 0.27 | 0.75 | | 1.86 | 4.23 | 6.08 |
| 203A | 0.44 | 0.75 | _ | 1.86 | 4.23 | 6.08 |
| 203B | 0.41 | 0.75 | 5 | 1.86 | 4.23 | 6.08 |
| 203C/D | 0.65 | 0.75 | | 1.86 | 4.23 | 6.08 |
| 204 | 0.28 | 0.75 | | 1.86 | 4.23 | 6.08 |
| PARK | 0.10 | 0.50 |] | 3.29 | 1.71 | 5.00 |
| ROW | 1.06 | 0.75 | | 1.86 | 0.00 | 1.86 |
| Site Total | 4.24 | 0.74 | 5 | 80.13 | 3.11 | 5.00 |

Table 11: Summary of Water Balance

By capturing a total depth of 6.08mm within each private Block, the Site as a whole will meet the 5.0mm capture depth target. This additional capture depth is anticipated to be re-used within each private Block as irrigation for landscape/green-roofs or toilet flushing. The Park catchment will be provided with an infiltration basin to meet its own 5mm requirement.

7.4 Stormwater Quality Control

As outlined in the City of Mississauga design criteria "Enhanced Level of Protection" of 80% TSS removal is required to treat runoff leaving the Site. The majority of the private Blocks consists of rooftop area which inherently meets 80% levels of TSS removal. Additionally, each private Block will contain a stormwater management detention tank which will allow for particle settling and a water harvesting/re-use component which will retain at minimum the first 5mm of runoff from each private Block. Private Blocks will be assessed at the time of Site Plan Approval if additional quality treatment controls are required for at-grade parking or driveway areas. This may be in the form of a private oil-grit separator or media filtration unit.

To provide quality control for the new ROW's, Streets A, B and C, an oil-grit separator is proposed at the downstream end of the new storm sewer network prior to connection to the existing 975mm sewer in Crumbie Street. Additional "at-source" controls can be implemented within ROW catchbasins, such as CB Shields or Litta Traps, which can achieve 50-60% TSS removal and improve longevity of downstream OGS units.

The combination of private and public quality controls will satisfy the overall requirement for 80% TSS removal for the site.

8.0 EROSION AND SEDIMENT CONTROL DURING CONSTRUCTION

Erosion and sediment controls will be installed prior to the commencement of any construction activities and will be maintained until the site is stabilized or as directed by the Site Engineer and/or the City of Mississauga. Controls will be inspected after each significant rainfall event and maintained in proper working condition. The following erosion and sediment controls will be provided during construction:

<u>Silt Fencing</u>

Silt fencing will be installed on the perimeter of the site to intercept sheet flow. Additional silt fence may be added based on field decisions by the Site Engineer and Owner, prior to, during and following construction.

Rock Mud Mat

A rock mud mat will be installed at the entrance of the construction zone in order to prevent mud tracking from the site onto the surrounding lands and perimeter roadway network. All construction traffic will be restricted to this access only.

Sediment Control Devices

A silt sack will be installed in all existing nearby storm sewer catch basins within the right of way. The silt sack will provide sediment control to prevent silt and sediment from entering the stormwater system.

A detailed Erosion and Sediment Controls plan will be submitted at the Site Plan stage.

9.0 PHASING DISCUSSION

As per the requirements set forth by the Region of Peel comments for project number DARC 22-493 W11; 120 & 146 Queen Street S and 169 Crumbie Street, the ownership and multi-use demand table for each proposed phase can be found in **Table 12** below.

| Phase | Buildings | Usage | Ownership | Estimated Year of Construction | Peak San Demand (L/s) | Max Day Water Demand (L/s) | Fire Flow Demand (L/s) | |
|------------|------------------|-------------------------------------|-----------|--------------------------------------|-----------------------------|-------------------------------------|------------------------------|-----|
| Phase | 1A | Multi (Res + Commercial, Office) | 2 | 2024 | 8.1 | 3.9 | 50 | |
| 1 | 1B | Multi (Res + Commercial) | Z | 2028 | 7.0 | 3.4 | 50 | |
| Phase | 2A | Residential | ntial 1 | | 7.5 | 3.6 | 50 | |
| 2 | 2B (Existing) | Commercial | 1 | 2030 | 0.0 | 0.0 | 100 | |
| | ЗA | Residential | 3-4 | | 7.3 | 3.5 | 50 | |
| Phase 3 | 3В | Residential | | 3-4 | 3-4 | 2034 | 7.2 | 3.5 |
| | 3C/D | Residential | | | 9.8 | 4.8 | 117 | |
| Phase | 4 | Multi (Res + Commercial) | 2 | | 4.3 | 2.1 | 50 | |
| 4 | Public Park | Park | City | 2038 | 0.03 | TBD | - | |

Table 12: Multi-Use Demand & Phasing Table

10.0 CONCLUSIONS & RECOMMENDATIONS

Based on the information contained within this summary report, we offer the following conclusions:

- 1. Water servicing is proposed via a 300mm diameter looped water service connection from the existing 300mm diameter waterman in Queen Street to the 200mm diameter watermain in Crumbie Street and William Street.
- 2. A maximum fire flow demand of 117 L/s for 2 hours is required, which is met by an available fire suppression capacity of 341 L/s at 20 psi in the existing watermain per a hydrant flow test carried out on June 19th, 2023.
- 3. Sanitary flows from the Site will outlet to either Queen Street or Crumbie Street, based on the proposed servicing configuration.
 - Buildings 1A, 1B and 4 will be serviced by the existing 300-375mm diameter sanitary sewers in Queen Street to accommodate peak flow of 18.2 L/s.
 - Buildings 2A, 3A, 3B and 3C/D will be serviced by a proposed 200-250 mm sanitary sewer in Street A and B and discharge into the existing 250 mm diameter sanitary sewer on Crumbie Street to accommodate a peak flow of 29.0 L/s.
- 4. Stormwater management controls will reduce and control up to the 100-year post development peak flows to the allowable pre-development flow rates which is identified by the 'Tannery Street Storm Sewer Design' drawing dated October 2012. A total catchment peak flow of approximately 1458.8 L/s towards Crumbie Street is equal to the pre-development flow rate for minor (10-yr) capture.
- 5. Stormwater quantity controls will be implemented within private Blocks only. Each block will control up to the 100-year storm event and reduce discharge to the allowable 10-year rate, including any foundation drainage to the storm sewer system. This will be implemented via SWM tank facilities in the underground structure of each building and utilize orifice controls to restrict discharge. No stormwater controls are proposed in the new public ROW's (Streets A, B, C or in the Public Park.
- 6. Water balance measures will be implemented within each new private block and each block will overcompensate for the new public ROW's. Each private block will be required to capture a total depth of approximately 6.08 mm through initial abstraction, infiltration, and/or re-use. No additional water balance measures beyond initial abstraction are proposed in the new public ROW's.
- 7. The water quality control of 80% TSS removal from the Site is achieved in the form of 1) particle settling within the SWM storage tanks/cisterns in each block, 2) private OGS units (if required, to be evaluated at Site Plan stage), and 3) a public OGS unit within Street A at the downstream connection point to Crumbie Street and (based on City recommendation) the inclusion of at-source infrastructure such as CB Shields or Litta Traps within ROW catchbasins.

Based on the previously presented information and conclusions, we request consideration for approval of the OPA, ZBA, and DPoS from the perspective of servicing and stormwater management.

Respectfully submitted,

C.F. CROZIER & ASSOCIATES INC.

Gamsa Sivanantham, P.Eng. Project Engineer

Rob Babic, P.Eng. Project Manager

Region of Peel Public Works, Design, Specifications & Procedures Manual - Watermain Design Criteria (June 2010)

Date: 27-Feb-2024 Designed By: GS Checked By: RB

Water Supply for Public Fire Protection (2020) Page 1 Proposed Building: Fire Underwriters Survey 1 Fire Flow per Fire Underwriter Survey 2020 1. An estimate of fire flow required for a given area may be determined by the formula: RFF = 220 * C * √A Where: RFF = fire flow in litres per minute C = coefficient related to the type of construction: = 1.5 for type V wood frame construction (structure essentially all combustible) for type IV-A mass timber construction for type IV-B mass timber construction 0.8 0.9 for type IV-C mass timber construction for type IV-D mass timber construction 1.0 1.5 1.0 for type III ordinary construction (brick or other masonry walls, combustible floor and interior) for type II non-combustible construction (unprotected metal structural components) 0.8 0.6 for type I fire-resistive construction (fully protected frame, floors, roof) A = The largest floor area in square meters (plus the following percentages of the total areas of the other floors). For Construction Coefficient from 1.0 to 1.5: = 100% of ALL Floor Areas For Construction Coefficient below 1.0: - Floors With Any Unprotected Vertical Openings in the Building = two largest adjoining floors + 50% all floors immediately above (max 8 floors) - Floors With Any Protected Vertical Openings and Protected Exterior Vertical Communications = largest floor area + 25% each of two immediately adjoining floors Proposed Buildings Area % Area: Floor 1 2023.0 1.0 0.25 Floor 2 1914.0 A= <u>2,928</u> sq.m Floor 3 1704.0 0.25 C= 0.6 Type of construction as confirmed by architect. (rounded to nearest 1000 L/min) Therefore RFF = 7.000 L/min Fire flow determined above shall not exceed: 30000 L/min for wood frame construction 30000 L/min for ordinary construction 25000 L/min for non-combustible construction 25000 L/min for fire-resistive construction Note: Maximum flows per ISO Guide for Determination of Needed Fire Flow, Chapter 2, Section 5 Maximum and Minimum Value of C (pg. 10). 2. Values obtained in No. 1 may be reduced by as much as 25% for occupancies having low contents fire hazard or may be increased by up to 25% surcharge for occupancies having a high fire hazard. Refer to Table 3 Recommended *Non-Combustible Free Burning 15% -25% Limited Combustible -15% Rapid Burning 25% Occupancy/Contents Charges by Major Occupancy Combustible 0% Examples. Occupancy Type: C Reduction %: -15% - 1,050 L/min reduction Therefore RFF = 5,950 Note: Flow determined shall not be less than 2,000 L/min per FUS Water Supply for Public Fire Protection (2020), Part 2 (pg. 33). Do not round to the nearest 1,000 LPM. 3. Sprinklers - The value obtained in No. 2 above may be reduced by up to 50% for complete automatic sprinkler protection. Automatic Sprinkler Design System Credit to part of building with coverage Automatic sprinkler protection designed and installed in accordance with NFPA 13. -30% Water supply is standard for both the system and -10% Fire Department hose lines. -10% Fully supervised system. Reduction %: _____ 50% 2,975 L/min reduction Total Reduced Flow = Note: Do not round to the nearest 1,000 LPM

REPORT N°. 2336

June 19, 2023

To: Mark Palmer mark@dezenrealty.com De Zen Realty Co. Ltd 4890 Tomken Road #1-4. Mississauga, ON L4W 1J8

RE: Watermain Capacity Test -142-148 Queen Street, Mississauga

Please find the Report for the following works

Scope: Conduct watermain Capacity Test as per NFPA291 / AWWA M17 recommendations and guidelines on the 300mm, 200mm and 150mm watermains including written report.

Hydrant Test Plan

Test Conclusion

 L/s
 USGPM

 TEST 1 - 300mm
 341
 5412
 at 20 psi

 TEST 2 - 200mm
 239
 3794
 at 20 psi

 TEST 3 - 150mm
 121
 1915
 at 20 psi

The system at the time of testing produced a projected theoretical flow rate of:

Hydrants are classified in accordance with NFPA291 S.5.1.

| COLOUR | CLASS | Available Flow @ 20psi |
|--------|-------|------------------------|
| BLUE | AA | 1500 GPM or more |
| GREEN | А | 1000 - 1499 GPM |
| ORANGE | В | 500 - 999 GPM |
| RED | С | Below 500 GPM |

We strongly feel that all attempts have been made to ensure that the required data as stipulated was captured, stored and presented in an accurate, efficient and timely manner for the required period.

We look forward to working with you in the future.

Please feel free to contact the undersigned should you require any further

Best Regards

Jante

Rob Gamache E.P Manager of Operations Hydrant Testing Ontario Info@HTOntario.ca

Notes:

1. Storm design criteria referenced from the City of Mississauga Transportation & Works Department, Development Requirements Manual Section 8 - Storm Drainage Design Requirements (November 2020).

2. Design sheet referenced City of Mississauga Transportation and Works Standard No. 2112.030 Storm Drainage Design Chart.

3. All proposed buildings will implement stormwater management controls to reduce peak flows to pre development levels to align with the Tannery Street Storm Sewer Design for Area Z-38W (City of Mississauga, October 2012). *Controlled release rate from proposed underground stormwater cistern.

Notes:

1. Storm design criteria referenced from the City of Mississauga Transportation & Works Department, Development Requirements Manual Section 8 - Storm Drainage Design Requirements (November 2020).

2. Design sheet referenced City of Mississauga Transportation and Works Standard No. 2112.030 Storm Drainage Design Chart.

3. All proposed buildings will implement stormwater management controls to reduce peak flows to pre development levels to align with the Tannery Street Storm Sewer Design for Area Z-38W (City of Mississauga, October 2012). *Controlled release rate from proposed underground stormwater cistern.
